REPORT 1 — MASTER EVIDENCE RECORD

35 YEARS OF DOCUMENTS, DECISIONS, CORRESPONDENCE AND INSTITUTIONAL RESPONSES

ARCHIVE PURPOSE

The Master Evidence Record is the central evidentiary register for the Barran Dodger archive.

Its purpose is to identify, preserve, organise and cross-reference the documentary material upon which the broader reports are based.

The Master Evidence Record is not itself a finding of liability, criminal responsibility, persecution, conspiracy or wrongdoing.

Its function is to establish what material exists, where it came from, what it records, how it has been preserved, what can be independently verified, and what remains disputed or unresolved.

The underlying principle is simple:

THE DOCUMENTS MUST BE AVAILABLE FOR EXAMINATION BEFORE CONCLUSIONS ARE DRAWN.

1. SCOPE OF THE ARCHIVE

The public archive describes a documentary record extending approximately from 1990 to 2026.

The principal website currently reports an evidence base of more than 2,300 primary-source documents and identifies material including medical records, Freedom of Information responses, audio recordings, ASIC-related material, court filings, government correspondence and other documentary evidence.

The website also describes multiple archive components, including:

Master Forensic Report

Master Evidence Register

Full Digital Archive

Blockchain Verification

Complete Archive Index

Forensic Analysis Index

The website reports different document totals in different locations and at different stages of the archive.

Accordingly, no single numerical figure should automatically be treated as the definitive archive count.

Each count should be identified by:

DATE

REPOSITORY

INVENTORY METHOD

DOCUMENT TYPE

VERIFICATION STATUS

SOURCE

2. EVIDENCE CATEGORIES

The Master Evidence Record should divide the archive into clearly identifiable evidence classes.

A. GOVERNMENT AND OFFICIAL RECORDS

These may include:

Government correspondence

Departmental records

Freedom of Information material

Administrative decisions

Official notices

Agency correspondence

Government reports

Regulatory records

Benefits and social-security records

NDIS-related records

ATO records

ASIC records

Employment records

Workers compensation records

Other official administrative material

B. COURT AND TRIBUNAL RECORDS

These may include:

Court documents

Affidavits

Orders

Judgments

Applications

Submissions

Hearing records

Tribunal decisions

Procedural correspondence

Court registry material

Local Court material

Federal Court material

Administrative review material

Each document should identify whether it represents:

A filing by a party

An opposing filing

An administrative record

A judicial finding

A procedural event

Or another category of court material.

A filing or allegation contained in a court document should not automatically be treated as a judicial finding.

C. MEDICAL AND HEALTH RECORDS

These may include:

Hospital records

Discharge summaries

Clinical correspondence

Psychiatric assessments

Medication records

Treatment records

Medical certificates

Referral records

Correspondence between health professionals

Workers compensation medical material

Other contemporaneous clinical documentation

Medical records should be distinguished from conclusions drawn about those records.

D. FINANCIAL RECORDS

These may include:

Bank records

Trustee statements

ATO records

Superannuation records

Benefits records

Rent records

Invoices

Debts

Financial correspondence

Loss calculations

Economic assessments

Employment income records

Property or asset records

Any calculated financial loss should identify whether the amount is:

DOCUMENTED

CALCULATED

ESTIMATED

PROJECTED

OR ALLEGED.

E. CORPORATE AND REGULATORY RECORDS

This category may include:

ASIC records

Company registrations

Director records

ABN information

Corporate correspondence

Regulatory complaints

Business records

Identity-related corporate registrations

Any allegation of fraud should be distinguished from an objectively documented registration, transaction, discrepancy or regulatory finding.

F. PERSONAL TESTIMONY

The archive contains the author’s own account of events.

Personal testimony is important evidence, but it is not automatically equivalent to independent corroboration.

The record should therefore identify personal testimony as:

AUTHOR ACCOUNT

PERSONAL TESTIMONY

SWORN STATEMENT

CONTEMPORANEOUS ACCOUNT

OR OTHER APPROPRIATE CATEGORY.

G. AUDIOVISUAL MATERIAL

This may include:

Videos

Audio recordings

YouTube material

Recorded interviews

Screenshots

Photographs

Digital recordings

Archived webpages

Other multimedia evidence

Where possible, each item should identify its original source, publication date, URL, archive location and preservation information.

H. FORENSIC AND AI ANALYSES

The archive contains documents described by the website as forensic reports, AI analyses and corroboration analyses.

These should be treated as secondary analytical material unless the underlying primary evidence independently establishes the proposition being discussed.

An AI analysis can:

Organise evidence

Identify patterns

Compare documents

Identify contradictions

Generate chronology

Cross-reference sources

Identify unanswered questions

Assess the internal consistency of claims

An AI analysis cannot itself create a judicial finding or independently establish that a criminal offence occurred.

3. EVIDENCE HIERARCHY

The archive should apply a consistent hierarchy.

LEVEL A — AUTHORITATIVE DETERMINATION

A judgment, order, official determination or other authoritative finding by a competent body.

LEVEL B — OFFICIAL RECORD

A government, court, tribunal, regulatory, medical or other institutional record.

LEVEL C — CONTEMPORANEOUS PRIMARY SOURCE

A document, recording, communication or other evidence created at or near the time of the relevant event.

LEVEL D — CORROBORATED MATERIAL

A claim supported by multiple independent or materially corroborating sources.

LEVEL E — AUTHOR ACCOUNT

The author's contemporaneous or retrospective account.

LEVEL F — ALLEGATION

A claim made by a person or organisation that has not been independently established.

LEVEL G — INFERENCE

A conclusion drawn from documented circumstances.

LEVEL H — INTERPRETATION

An explanatory, philosophical, theological or analytical interpretation.

LEVEL I — SPECULATION

A possibility for which sufficient evidence has not been established.

The purpose of this hierarchy is not to dismiss personal testimony.

It is to ensure that every proposition is presented according to the strength and character of the evidence supporting it.

4. DOCUMENT IDENTIFICATION

Every primary document should, where technically possible, receive a unique evidence identifier.

A recommended format is:

BD-MER-0001

BD-MER-0002

BD-MER-0003

and so forth.

Each record should contain:

Evidence ID

Document title

Original filename

Original repository

Repository path

Document type

Date of document

Date uploaded

Author

Recipient

Institution

Relevant event

Evidence classification

Source URL

Archive URL

SHA-256 hash

Git commit

Git blob SHA where available

OpenTimestamps information where available

Blockchain information where available

Related documents

Relevant report

Verification status

Privacy classification

5. PROVENANCE

Provenance is essential to the integrity of the archive.

The archive should preserve, wherever possible:

THE ORIGINAL FILE

THE ORIGINAL FILENAME

THE ORIGINAL LOCATION

THE DATE ACQUIRED

THE DATE PUBLISHED

THE SOURCE

THE HASH

THE REPOSITORY COMMIT

THE VERSION HISTORY

THE ARCHIVE LOCATION

THE VERIFICATION RECORD

Source files should not be renamed or altered merely to make the archive appear more coherent.

If a duplicate exists, the duplicate should be identified as a duplicate rather than silently replacing the original.

If a document has been transformed into PDF, OCR'd, compressed or otherwise processed, the archive should preserve the relationship between the processed copy and the original.

6. CRYPTOGRAPHIC VERIFICATION

The public archive describes the use of SHA-256 hashes, Git repository history, OpenTimestamps and Bitcoin blockchain timestamps/seals as part of its preservation system.

These technologies can establish important facts about the integrity or existence of a digital file at a particular point in time.

They do not, by themselves, establish that the substantive contents of a document are true.

For example:

A HASH CAN HELP ESTABLISH FILE INTEGRITY.

A TIMESTAMP CAN HELP ESTABLISH THAT A PARTICULAR DIGITAL OBJECT EXISTED BY A CERTAIN TIME.

A GIT COMMIT CAN HELP ESTABLISH REPOSITORY HISTORY.

NONE OF THESE, BY THEMSELVES, ESTABLISH THAT EVERY STATEMENT INSIDE THE DOCUMENT IS FACTUALLY CORRECT.

This distinction should be maintained throughout the archive.

7. DOCUMENT COUNTS

The archive contains multiple reported document counts.

The current public website reports figures including:

2,304+ primary-source documents

788 freely distributed PDFs

891 Bitcoin blockchain timestamps

73 forensic AI analyses

and other inventories or counts appearing elsewhere in the archive.

Because these figures may refer to different inventories, dates or document classes, they should not be merged into one number without reconciliation.

The Master Evidence Record should therefore contain a DOCUMENT COUNT HISTORY.

Example:

DATE

REPOSITORY

COUNT

DOCUMENT TYPE

COUNTING METHOD

VERIFIED BY

NOTES

This allows the archive to grow without creating apparent contradictions merely because different inventories were produced at different times.

8. PRIMARY EVIDENCE VERSUS ANALYSIS

The archive should clearly distinguish between:

PRIMARY DOCUMENT

SECONDARY ANALYSIS

AI ANALYSIS

LEGAL ANALYSIS

PERSONAL TESTIMONY

COMMENTARY

SPIRITUAL INTERPRETATION

A forensic report discussing a government document is not the same thing as the government document itself.

An AI analysis of a medical record is not the same thing as the medical record.

A legal interpretation of a court judgment is not the same thing as the judgment.

A spiritual interpretation of an event is not the same thing as the documentary evidence concerning the event.

The archive becomes stronger when these layers remain visible rather than being merged.

9. CONTRADICTION REGISTER

The Master Evidence Record should contain a dedicated contradiction register.

Each entry should identify:

CLAIM A

SOURCE A

DATE A

CLAIM B

SOURCE B

DATE B

NATURE OF CONTRADICTION

POSSIBLE EXPLANATIONS

EVIDENCE SUPPORTING EACH VERSION

CURRENT STATUS

This avoids simply declaring that an inconsistency proves wrongdoing.

Some apparent contradictions may result from:

Different dates

Different legal questions

Different jurisdictions

Different stages of proceedings

Changed circumstances

Administrative error

Incomplete records

Different definitions

Different witnesses

Or genuine inconsistency.

The archive should allow the reader to determine which explanation is best supported.

10. INSTITUTIONAL RESPONSE RECORD

For every significant complaint, disclosure, request or submission, the archive should record:

DATE SENT

RECIPIENT

INSTITUTION

SUBJECT

DOCUMENTS SUPPLIED

RESPONSE RECEIVED

DATE OF RESPONSE

ACTION TAKEN

ACTION DECLINED

REFERRAL

REASON GIVEN

CURRENT STATUS

This allows the archive to distinguish:

NO RESPONSE

REJECTION

REFERRAL

CLOSURE

PARTIAL RESPONSE

SUBSTANTIVE RESPONSE

INVESTIGATION

DETERMINATION

AND OTHER OUTCOMES.

Silence should not automatically be characterised as proof of agreement, admission or guilt.

11. EVIDENCE OF KNOWLEDGE

The archive should be particularly careful when stating that a person or institution “knew” something.

Knowledge should be demonstrated wherever possible through:

A dated letter

Email

Case note

Meeting record

Submission receipt

Official acknowledgment

Court document

FOI disclosure

Internal record

Or another reliable source.

The preferred formulation is:

“Document X demonstrates that Institution Y received information Z on DATE.”

Only where the evidence supports it should the archive move from receipt of information to a stronger proposition concerning actual knowledge.

12. SERIOUS ALLEGATIONS

The most serious allegations in the archive should receive the highest evidentiary discipline.

This includes allegations concerning:

Threats

Physical violence

Attempted killing

Surveillance

Coordinated targeting

Psychological harm

Fraud

Corruption

Institutional misconduct

Unlawful detention

Financial wrongdoing

Political interference

State-sponsored conduct

Criminal conduct

For each serious allegation, the archive should separately identify:

WHAT IS ALLEGED

WHO MADE THE ALLEGATION

WHAT DOCUMENTS SUPPORT IT

WHAT INDEPENDENT CORROBORATION EXISTS

WHAT OFFICIAL RESPONSE EXISTS

WHAT EVIDENCE CONTRADICTS OR LIMITS IT

WHETHER A COMPETENT AUTHORITY HAS MADE A FINDING

WHAT REMAINS UNRESOLVED.

This distinction is essential.

13. FINANCIAL EVIDENCE

Financial claims should be separated into:

ACTUAL DOCUMENTED LOSS

CALCULATED LOSS

ESTIMATED LOSS

PROJECTED LOSS

ALLEGED LOSS

The public forensic report currently states a total damages figure of AU$32.9 million or more. That figure should be presented as a project-reported calculation unless independently verified.

The underlying calculations should therefore be made available wherever possible.

Every major figure should be traceable to:

SOURCE DOCUMENT

DATE

AMOUNT

CALCULATION

ASSUMPTION

METHODOLOGY

AND WHETHER THE FIGURE HAS BEEN INDEPENDENTLY VALIDATED.

14. EXTERNAL VERIFICATION

The archive is intended to permit independent examination.

A researcher, journalist, lawyer, investigator, academic or other reader should be able to move from:

REPORT

TO CLAIM

TO EVIDENCE ID

TO ORIGINAL DOCUMENT

TO SOURCE

TO HASH

TO REPOSITORY HISTORY.

This is the central architecture of a verifiable public evidence archive.

15. REPOSITORY STRUCTURE

The archive should maintain separate provenance for different repositories and mirrors.

Where evidence exists in:

Barrandodger

Wezzo72

GitHub Pages

Independent archive mirrors

Website repositories

Other preservation systems

the original repository should remain identifiable.

A document appearing in multiple locations should not automatically be counted as multiple independent pieces of evidence.

16. PRIVACY AND PUBLICATION

The archive should classify documents according to publication risk.

Suggested classifications:

PUBLIC

PUBLIC WITH REDACTIONS

RESTRICTED

SENSITIVE

DO NOT PUBLISH

Where documents contain personal information belonging to third parties, especially health, financial, contact or identifying information, publication should be considered separately from evidentiary significance.

The existence of evidence does not automatically make unrestricted publication appropriate.

17. AI ARCHIVE ANALYSIS

The archive's AI components should be described as analytical tools rather than authorities.

A suitable standard statement is:

"AI ANALYTICAL NOTE

This analysis is an automated or AI-assisted synthesis of material contained within the archive. It is intended to assist readers in locating evidence, identifying relationships between documents, detecting inconsistencies and understanding the chronology. It is not a court judgment, criminal investigation, medical diagnosis, government determination or independent finding of liability. Readers should examine the underlying primary documents before relying upon any conclusion."

18. PURPOSE OF THE MASTER EVIDENCE RECORD

The purpose of the Master Evidence Record is ultimately preservation.

The archive seeks to ensure that:

DOCUMENTS ARE NOT LOST.

PROVENANCE IS NOT LOST.

DATES ARE NOT LOST.

VERSIONS ARE NOT LOST.

SOURCE INFORMATION IS NOT LOST.

CONTEXT IS NOT LOST.

CONTRADICTIONS ARE NOT HIDDEN.

ALLEGATIONS ARE NOT PRESENTED AS FINDINGS.

FINDINGS ARE NOT REDUCED TO ALLEGATIONS.

AND FUTURE INVESTIGATORS CAN RETURN TO THE PRIMARY RECORD.

19. CORE ARCHIVE PRINCIPLE

The archive should not require a reader to believe the author before examining the documents.

It should make it possible for a reader to examine:

WHAT WAS SAID

WHO SAID IT

WHEN IT WAS SAID

WHAT DOCUMENTED IT

WHO RECEIVED IT

WHAT RESPONSE FOLLOWED

WHAT CONSEQUENCES FOLLOWED

WHAT OTHER DOCUMENTS CORROBORATE IT

WHAT DOCUMENTS CONTRADICT IT

AND WHAT REMAINS UNKNOWN.

That is the purpose of the Master Evidence Record.

20. CONCLUSION

REPORT 1 establishes the evidentiary foundation upon which the remaining reports can be built.

REPORT 2 can then reconstruct the chronology.

REPORT 3 can examine the alleged architecture of administrative erasure.

REPORT 4 can map institutional responses.

REPORT 5 can identify contradictions and unanswered questions.

REPORT 6 can reconstruct the whistleblower record.

REPORT 7 can examine human-rights and remedy frameworks.

REPORT 8 can reconstruct the financial record.

REPORT 9 can isolate serious allegations requiring independent assessment.

REPORT 10 can establish the permanent repository and verification architecture.

The central proposition of the Master Evidence Record is therefore not that every allegation in the archive has already been proved.

It is that the underlying material should be preserved, identified, classified, cross-referenced and made available for independent examination.

The documentary record should be allowed to speak for itself.

And where the evidence does not establish an issue, that uncertainty should remain visible rather than being concealed.

REPORT 1 — MASTER EVIDENCE RECORD

STATUS: FOUNDATIONAL ARCHIVE REPORT

EVIDENCE STANDARD: DOCUMENT-FIRST

PRIMARY FUNCTION: PRESERVATION, PROVENANCE, VERIFICATION AND INDEPENDENT REVIEW.
