# The data-set question

01

### There is no buyer.

Corporate data brokers, AI-training corpora and list vendors are the only people who purchase "data sets". A corpus about one person's dispute with one government is not a product any of them can use — and every one of them is the wrong partner for this record.

02

### The sensitive parts are the unlawful parts to sell.

The archive carries health, disability, psychiatric and sexuality material. That is special-category personal information. Selling it is unlawful under Australian privacy law whether or not you are its subject.

03

### It names living people in allegations that are not proven.

Australian defamation law is famously plaintiff-friendly. Publishing an allegation in a free public-interest record and selling that same allegation in a paid product are treated very differently — the paid version carries damages.

04

### You do not own everything inside it.

Government correspondence and third-party documents carry their own copyright and re-use conditions. An archive you may lawfully publish is not the same as a portfolio you may lawfully sell.

05

### Selling access destroys the only thing giving it value.

The archive's own promise is "download, fork, and share freely". Its authority rests on nobody being able to say the record was monetised or gated. Charge for the curated layer — books, analysis, teaching, your time — and keep the evidence free.

---

*Put the data-set idea aside permanently. Treated as a data set, this is a liability. Treated as a story and a mission, it is an income.*
