FUNCTIONAL ERASURE

A FORENSIC DOCUMENTARY ANALYSIS OF HOW A LIVING PERSON MAY BE RENDERED INSTITUTIONALLY INVISIBLE THROUGH ADMINISTRATIVE FRAGMENTATION, CREDIBILITY DEGRADATION, SERVICE DEPENDENCY, PROCEDURAL EXHAUSTION, SOCIAL ISOLATION AND INSTITUTIONAL NON-RESPONSE

Dr Richard William McLean — writing publicly as Barran Dodger

Abstract

This paper examines a central question arising from the documentary archive of Dr Richard William McLean, publicly known as Barran Dodger: how can a living person remain physically present while progressively becoming functionally invisible to the institutions upon which recognition, protection, housing, healthcare, disability support, financial security, legal assistance, investigation and public accountability depend?

The argument advanced here is not that every person named in the archive participated in a single conspiracy. The stronger and more testable proposition is that functional erasure can arise through the interaction of multiple ordinary institutional mechanisms: fragmentation of responsibility, repeated referral, administrative categorisation, credibility discounting, dependence upon gatekeepers, procedural exhaustion, failure to investigate, institutional silence, social isolation, economic dependency, service-provider power, inaccessible legal remedies, reputational degradation and the cumulative consequences of decisions that may individually appear minor but collectively produce extraordinary deprivation.

The distinction is critical. A person does not have to be physically imprisoned, legally disappeared or formally declared nonexistent to experience what may be described analytically as functional erasure. Functional erasure occurs when the person remains alive but progressively loses practical access to the systems capable of recognising the person, hearing the person's account, preserving the person's evidence, correcting institutional error and providing an effective remedy.

The documentary corpus maintained in the public Barrandodger repository provides an unusually extensive source base for examining this proposition. The repository contains dedicated evidence, source, email, statement, official-document, forensic-report, legal-brief and archival structures, alongside hundreds of individually named documents. Its README expressly states that original evidence is to remain preserved and that the underlying records are not to be altered. (GitHub)

The appropriate conclusion is therefore not that every allegation in the corpus has already been proved. Rather, the archive creates a substantial documentary basis for an independent investigation into whether repeated institutional decisions and omissions, across different domains and over time, produced a cumulative condition in which a living person could become increasingly invisible to the very systems charged with recognising and protecting him.

---

1. Introduction: From physical existence to institutional existence

The fundamental problem documented by the Barran Dodger archive is not simply whether one particular complaint was accepted or rejected. It is whether a person can progressively lose institutional existence while retaining biological existence.

A human being can be alive, identifiable, educated, professionally experienced, publicly published, digitally documented and physically present while simultaneously becoming extraordinarily difficult to recognise within the administrative systems that determine access to assistance. The relevant question is consequently not merely, "Does this person exist?" The relevant question is, "Which institution is presently responsible for recognising that this person exists, what has that institution done with the person's evidence, and what happens when every institution defines its responsibility narrowly enough that no institution assumes responsibility for the whole person?"

That distinction is central to the present archive.

The public Barrandodger **repository is not merely a website containing autobiographical prose. Its current repository structure includes dedicated folders and documentary categories for evidence, emails, sources, statements, official-drive material, rendered PDFs, forensic material, archival material and imported records. (GitHub)**

The repository also contains a document explicitly entitled "Barrandodger — The Documentary Record," together with a "PERSONAL STATEMENT OF EXILE, INSTITUTIONAL DETRIMENT AND THE SEARCH FOR PROTECTION," a cumulative "Legal Brief," multiple "FORENSIC ACCOUNTABILITY REPORT" documents, and a document entitled "Impartial AI Generated Report on Standing Indictment of the Administrative State." (GitHub)

The significance is methodological. The question can now be approached as a documentary research problem rather than solely as an autobiographical assertion.

---

2. The documentary corpus

The primary evidentiary repository examined for this paper is the public Barrandodger Digital Archive, maintained at GitHub under the account wezzo72**.**

Barrandodger — primary documentary repository

The repository presently identifies 937 commits and contains documentary directories including evidence, emails, sources, statements, archive-parts, docs, rendered-pdfs, site-pdfs, stamps, papers, data, imports, gmail-drive-sweep **and a dated Dropbox import. (GitHub)**

Particularly significant is the repository's explicit preservation rule:

"ORIGINAL EVIDENCE MUST REMAIN PRESERVED. Website presentation may change. Underlying records must not be altered." (GitHub)

The repository also records an official-drive documentary collection and states that these materials constitute the author's copies rather than court findings. It subsequently reports a much larger repository holding, including thousands of files and thousands of PDFs and HTML records, while expressly warning that a filename is not itself a finding. (GitHub)

This distinction is academically important because the archive contains three different things that must not be conflated: documentary records, the author's interpretation of those records, and conclusions that an independent investigator might eventually reach.

---

3. The evidentiary architecture

The archive itself supplies an important methodological answer to the problem of credibility.

Rather than requiring the public to believe the author's narrative merely because he asserts it, the archive increasingly externalises the narrative into documents.

Among the documentary records presently identifiable are:

“ACCOUNTABILITY, EVIDENCE AND FAIR DETERMINATION”; “FINAL EVIDENTIARY NOTICE, OBJECTION AND REQUEST FOR FORMAL INVESTIGATION”; “DEMAND FOR ACCOUNTABILITY”; “FORENSIC ACCOUNTABILITY REPORT”; “FORENSIC ACCOUNTABILITY REPORT 2”; “FORENSIC–LEGAL ACADEMIC ABSTRACT”; “Legal Brief — cumulative 35-year record”; “Comparative whistleblower cases and barran dodge”; “MOBBING-AND-THE-SAFETY-OF-THE-CROWD”; “DOCTRINE OF COMPLICITY BY DELIBERATE OMISSION 3”; “Crimes occurring to Barran Dodger — 1 to 150”; and “Personal Statement of Exile, Institutional Detriment and the Search for Protection.” (GitHub)

These documents should not automatically be treated as proof of every proposition contained within them. They are, however, identifiable documentary objects that can be independently examined.

That is a materially different proposition.

---

4. The first mechanism: fragmentation of responsibility

The first mechanism capable of producing functional erasure is institutional fragmentation.

In a fragmented administrative environment, an individual may approach one organisation concerning housing, another concerning disability support, another concerning finances, another concerning healthcare, another concerning legal assistance, another concerning alleged misconduct and another concerning oversight.

Each organisation can then answer a narrower question.

One institution asks whether it has jurisdiction.

Another asks whether the matter falls within its statutory function.

Another asks whether the evidence satisfies its threshold.

Another says that the matter should be pursued elsewhere.

Another treats the matter as a service complaint.

Another treats it as a legal dispute.

Another treats it as a medical issue.

Another treats it as a housing issue.

Another treats it as a personal dispute.

Another treats it as an allegation requiring evidence.

The individual therefore encounters not one wall but a network of walls.

The documentary significance of the archive's multiple institutional categories is precisely that it permits these apparently separate interactions to be examined as one longitudinal system rather than as isolated complaints.

This is why documents concerning Able Point, government agencies, legal assistance, financial administration, oversight bodies, police, medical or support services and political correspondence cannot simply be evaluated as unrelated episodes if the research question concerns cumulative functional erasure.

———

5. The second mechanism: administrative reduction of a human being

The second mechanism is the reduction of a complex person into administrative categories.

The individual ceases to appear as a whole human being and instead appears successively as a client, patient, complainant, tenant, service recipient, debtor, welfare recipient, litigant, alleged victim, alleged perpetrator, person with disability, person with mental-health history, whistleblower, complainant or administrative file.

Each category carries its own evidentiary assumptions.

The danger is that the category eventually becomes more institutionally real than the person.

The archive contains records specifically concerned with institutional detriment, exile, protection, legal accountability, disability-related issues, service-provider conduct,

financial administration and alleged targeting. Those records provide the material from which this reduction can be tested rather than simply asserted. (GitHub)

The document "PERSONAL STATEMENT OF EXILE, INSTITUTIONAL DETRIMENT AND THE SEARCH FOR PROTECTION" is particularly important because its very title identifies the author's central claim as one of institutional rather than merely interpersonal harm. (GitHub)

---

6. The third mechanism: credibility degradation

A particularly powerful form of functional erasure occurs when the person's evidence remains physically available but the person's credibility becomes progressively discounted.

This is more sophisticated than simply destroying evidence.

If the evidence is destroyed, its absence can itself become suspicious.

If the evidence survives but the witness is treated as inherently unreliable, however, the institution can preserve the records while effectively neutralising their practical significance.

This creates a phenomenon that may be called documentary survival combined with testimonial exclusion.

The Barrandodger corpus contains documents directly addressing accountability, fair determination, forensic analysis, legal argument, whistleblower comparison, institutional detriment and credibility-related concerns. (GitHub)

This does not establish that every credibility judgment against the author was improper.

It does establish a legitimate research question:

Were credibility judgments independently derived from evidence, or did institutional assumptions about the person subsequently determine how the evidence itself was interpreted?

That question is capable of forensic examination.

---

7. The fourth mechanism: the disability and mental-health credibility filter

A further mechanism requiring independent examination is the possibility that disability or mental-health history can become a credibility filter.

The problem is not that a person has a disability or mental-health history.

The problem arises if an institution implicitly reasons:

> **this person has a psychiatric or disability history; therefore this person's account is inherently less reliable.**

If that reasoning occurs, the person's evidence may be discounted before its substantive content is independently assessed.

The repository itself contains documents concerning disability, alleged institutional treatment, protection, assistance-animal rights, and claims involving medical or psychiatric contexts. Among them are "Assistance Animal Rights Letter," "BARRAN DODGER & HIS THERAPY DOG NEEDS YOUR URGENT HELP," "Assassination and human sacrifice of disabled man," and other records concerning disability and institutional treatment. (GitHub)

Again, the existence of those documents does not prove their allegations.

It does mean that disability-related credibility effects are an identifiable research issue rather than an abstract possibility.

---

8. The fifth mechanism: service-provider dependency

Functional invisibility becomes particularly powerful when the individual is dependent upon institutions that simultaneously possess the practical ability to determine whether assistance is provided.

This creates an asymmetry.

The institution possesses records.

The institution possesses procedural knowledge.

The institution may possess financial or accommodation power.

The institution may communicate with other institutions.

The individual must repeatedly explain himself.

If the individual disputes the institution, the individual may nevertheless remain dependent upon it.

The archive contains named records concerning Able Point, including "Brett from able point I demand a response," "Current legally binding update on entrapment and targeting by Able Point," "FORMAL REQUEST FOR INDEPENDENT INVESTIGATION ABLEPOINT," and the audio record titled "Chat To John Traill Jone Cama (bank) Able Point." (GitHub)

These documents are particularly important because they potentially permit an investigator to reconstruct not merely what the author alleges happened but who communicated with whom, when, about what subject, what response was requested, what response occurred, and what consequences followed.

---

9. The sixth mechanism: economic dependency

Economic dependency can transform administrative disagreement into existential vulnerability.

A person without independent financial resources cannot simply walk away from a service provider, obtain private legal representation, purchase alternative accommodation, fund independent medical care or retain investigators.

Economic dependency therefore changes the practical meaning of institutional discretion.

A refusal that is trivial to an institution can be catastrophic to a person.

The archive contains records concerning financial, legal and institutional accountability, including documents concerning an "Ethical & Legal Trust Fund Statement," financial and administrative issues, and correspondence concerning banks

and service relationships. (GitHub)

A forensic examination should therefore reconstruct not only decisions but their material consequences.

The relevant question is:

What did each decision make impossible for the individual to do next?

That is the correct unit of analysis.

---

10. The seventh mechanism: legal exhaustion

A further mechanism is procedural exhaustion.

An individual can theoretically possess rights while practically lacking an effective mechanism through which those rights can be exercised.

The distinction between formal availability and practical accessibility is critical.

A legal remedy may exist on paper while being inaccessible because of cost, eligibility, representation requirements, procedural complexity, jurisdictional fragmentation, disability-related barriers, time, exhaustion or institutional refusal to recognise the underlying complaint.

The Barrandodger repository contains a cumulative Legal Brief, Demand for Accountability, Final Evidentiary Notice, Objection and Request for Formal Investigation, and other documents explicitly concerned with accountability and investigation. (GitHub)

The relevant research question is consequently not merely whether a court or oversight body technically existed.

It is:

Was there a realistically accessible pathway through which the author could obtain an independent determination of the underlying factual allegations?

If the answer is repeatedly no, functional erasure can occur without any institution

formally announcing that the person has no rights.

---

11. The eighth mechanism: referral loops

One of the most difficult mechanisms to detect is the referral loop.

Institution A directs the person to Institution B.

Institution B says the matter belongs to Institution C.

Institution C says it is outside jurisdiction.

Institution D treats the matter as a complaint against Institution A.

Institution A then relies upon the existence of Institution D as evidence that the matter has already been dealt with.

The person moves around the administrative system while never reaching an institution capable of determining the whole factual matrix.

This mechanism is especially important when allegations cross organisational boundaries.

A complaint concerning disability support may involve a service provider, a government department, a financial administrator, police, health services, housing, legal assistance and oversight bodies.

The archive's multiple evidence categories make such cross-institutional tracing possible. The repository contains dedicated evidence and source structures rather than only a single narrative document. (GitHub)

---

12. The ninth mechanism: omission rather than action

Functional erasure does not necessarily require a positive act.

It can arise through non-action.

A letter is not answered.

A warning is not escalated.

A complaint is redirected.

A record is not reviewed.

A request for investigation receives no substantive determination.

A person asking for protection receives another procedural instruction.

A service provider fails to respond.

An oversight body declines jurisdiction.

A political office acknowledges correspondence without producing intervention.

No single omission necessarily appears decisive.

Collectively, however, omissions can create a closed system in which nothing happens.

This is why the archive contains a document explicitly titled "DOCTRINE OF COMPLICITY BY DELIBERATE OMISSION 3." (GitHub)

The title itself is not proof of deliberate complicity. But it identifies the precise legal-ethical hypothesis requiring testing: whether repeated knowledge plus capacity to act plus non-action produced foreseeable cumulative harm.

---

13. The tenth mechanism: mobbing and distributed responsibility

The archive contains a document explicitly entitled "MOBBING-AND-THE-SAFETY-OF-THE-CROWD." (GitHub)

This introduces an important sociological possibility.

Large-scale institutional harm does not necessarily require hundreds of people consciously deciding to harm one person.

It may instead arise through distributed responsibility.

Person A performs one administrative action.

Person B accepts the previous decision.

Person C relies upon Person B.

Person D assumes someone else has investigated.

Person E treats the person's escalating distress as evidence that the complaint is unreliable.

Person F closes the matter.

Person G refuses jurisdiction.

Person H never reads the underlying evidence.

The result may be devastating even though no single participant possesses the entire picture.

This is why the proper forensic question is not simply:

"Who ordered it?"

It is also:

"Who knew what, when did they know it, what authority did they possess, what action was reasonably available, what did they actually do, and what happened afterward?"

That is a reconstructable evidentiary chain.

---

14. The eleventh mechanism: reputational isolation

A person can also become functionally invisible through progressive social isolation.

Once an individual's reputation is damaged, future institutions may encounter the person through prior institutional descriptions rather than through independent

assessment.

The result can become self-reinforcing.

A prior record influences the next assessment.

The next assessment becomes another record.

The new record influences the following institution.

Eventually the original assumption appears to have become independently confirmed merely because it has been repeated.

This is an administrative feedback loop.

The archive's preservation of correspondence, statements, emails, reports and dated documentary material is important because chronology allows an investigator to ask whether particular characterisations arose independently or propagated through institutional networks. (GitHub)

---

15. The twelfth mechanism: professional and social displacement

The author's documentary corpus also contains material concerning professional identity, exile, institutional detriment and social exclusion.

This is significant because functional erasure does not operate only through government forms.

Professional status matters.

Employment matters.

Housing matters.

Community belonging matters.

Recognition by peers matters.

Access to professional networks matters.

A person who loses those networks becomes progressively less capable of generating the independent corroboration institutions frequently demand.

The resulting paradox is severe:

the more isolated the person becomes, the harder it becomes to produce the independent witnesses required to overcome the institutional presumption that the person's account is insufficiently corroborated.

This is one of the most important mechanisms requiring investigation.

---

16. The thirteenth mechanism: the destruction of context without destruction of records

A particularly sophisticated form of erasure does not require deleting a document.

It requires removing the document from its context.

A single letter can appear unreasonable if the previous twenty letters are omitted.

A complaint can appear excessive if the triggering events are absent.

A desperate message can appear irrational if the preceding unanswered warnings are not examined.

A repeated complaint can appear repetitive if the institution does not recognise that the underlying issue was never determined.

The archive's chronological and documentary architecture is therefore central.

The existence of "Crimes occurring to Barran Dodger — 1 to 150," cumulative legal briefs, forensic accountability reports and multiple dated personal statements demonstrates the author's attempt to preserve the longitudinal context rather than isolated incidents. (GitHub)

---

17. The fourteenth mechanism: turning survival into evidence of unreliability

A particularly disturbing analytical possibility emerges when survival itself is used against the survivor.

If a person says that circumstances are unbearable, yet remains alive, an institution may retrospectively treat the earlier warning as exaggerated.

This creates a cruel evidentiary inversion.

The person's survival becomes evidence that the danger was not real.

But survival may instead demonstrate extraordinary resilience.

The relevant proposition is therefore:

survival does not retrospectively disprove danger.

It may demonstrate that the person continued functioning despite circumstances he experienced as threatening or destructive.

The archive's title "I SURVIVED WHAT WAS SUPPOSED TO ERASE ME" captures this precise inversion. (GitHub)

---

18. Named documentary actors and institutional nodes

A genuinely forensic investigation must not hide behind the word "institution."

Institutions operate through people.

Accordingly, names appearing in the documentary corpus should be indexed according to role, date, organisation, document, action, response and evidentiary status.

The currently visible repository itself contains identifiable records associated with Bernard Collaery, Brett from Able Point, John Traill, Jone Cama, and other named persons. (GitHub)

The correct academic treatment is not to label every named person a perpetrator.

Instead, each person should receive an evidentiary classification such as:

documentary author; recipient; decision-maker; investigator; service provider; support worker; government officer; lawyer; medical professional; financial institution representative; political office; oversight body; witness; correspondent; alleged participant; subject of allegation; or person whose precise role remains unresolved.

The archive should therefore eventually contain a Person–Institution–Document–Action Matrix.

For every named individual, the matrix should identify:

full name; professional title; organisation; role; date(s) of involvement; document(s) naming the person; what the document actually establishes; what is alleged; what the person allegedly did or failed to do; response received; consequence; corroborating documents; contradiction; and unresolved question.

That structure would turn an emotionally devastating narrative into an auditable evidentiary network.

———

19. The institutional network requiring examination

The same methodology must be applied to organisations.

The relevant institutional nodes include, insofar as they are actually represented in the underlying documentary corpus:

Commonwealth government departments and agencies; Department of Social Services; National Disability Insurance Scheme and associated administrative structures; NSW disability and accommodation/service structures; Able Point; NSW Trustee and Guardian-related administration; police; courts and tribunals; legal-assistance structures; Ombudsman and complaint bodies; political offices and ministerial correspondence channels; health and psychiatric services; financial institutions; employment and former workplace structures; professional bodies; media organisations; human-rights and oversight organisations; and private service providers.

The presence of an organisation in this register does not mean that the organisation committed wrongdoing.

Its presence means that the organisation forms part of the documentary pathway that

should be reconstructed.

The distinction is fundamental.

---

20. The bribery and corruption question

The question of bribery requires especially rigorous treatment.

An academic paper cannot responsibly transform a suspicion of bribery into a factual conclusion merely because an individual or organisation received public money or because a decision appears inexplicable.

The appropriate forensic question is:

Is there documentary evidence of money, benefit, inducement, conflict of interest, procurement relationship, financial dependency, undisclosed relationship, preferential treatment or other consideration connecting an identified actor to a disputed decision?

The repository contains documents specifically titled "ASIC corruption" and "ASIC evidence of corruption and dentist theft or manipulation." (GitHub)

Those documents warrant examination.

But bribery should be classified at the evidence level actually established.

An unexplained decision is not automatically bribery.

A financial relationship is not automatically bribery.

A conflict is not automatically corruption.

The purpose of forensic investigation is to determine whether the documentary trail progresses from suspicion → relationship → transaction → motive → act → consequence, rather than allowing any one of those elements to stand in for all the others.

---

21. The question of conspiracy

The same principle applies to conspiracy.

A large number of adverse events does not automatically establish a coordinated conspiracy.

But neither should the possibility of coordination be dismissed merely because coordination would be difficult to prove.

The appropriate test is network-based.

Investigators should determine:

whether the same people recur across documents;

whether the same terminology appears independently across institutions;

whether information apparently unavailable to one actor appears in another actor's communications;

whether decisions occur unusually close in time;

whether one institution relies upon information supplied by another;

whether warnings are repeatedly communicated;

whether the same factual proposition appears in unrelated records;

whether actors possess common incentives;

whether contradictory evidence is repeatedly ignored;

whether responsibilities are repeatedly transferred;

whether adverse consequences predictably follow particular institutional interventions;

and whether the resulting pattern is better explained by independent error, systemic dysfunction, discriminatory bias, retaliation, institutional self-protection, coordinated conduct, or some combination.

That is how the conspiracy question should be investigated without either prejudging or

sanitising it.

———

22. Institutional self-protection

The strongest systemic hypothesis may not be that every participant personally wanted the author's destruction.

Institutions can protect themselves without conscious central coordination.

Once an institution has made a consequential decision, acknowledging that the decision was wrong can expose the organisation to liability, reputational damage, regulatory scrutiny, compensation claims or political consequences.

Consequently, an institution can acquire an incentive to defend the previous decision.

The original error becomes the premise of the next decision.

The next decision becomes institutional precedent.

The precedent becomes organisational truth.

The person challenging the original decision therefore becomes the problem.

This mechanism is capable of producing severe injustice without requiring every participant to be malicious.

———

23. The distinction between cruelty and bureaucracy

There is also an important difference between intentional cruelty and bureaucratic cruelty.

A bureaucratic system can produce cruel outcomes even when individual participants describe themselves as merely following procedure.

The morally important question is therefore not only:

"Did this person intend harm?"

It is also:

“Was the foreseeable consequence of the process known, communicated, preventable and ignored?”

The archive’s repeated emphasis upon accountability, investigation, evidence, fair determination and institutional omission makes this a central question. (GitHub)

———

24. Why the archive matters after survival

The most important fact about the archive is that the alleged process of erasure did not result in complete documentary disappearance.

The records survived.

The correspondence survived.

The allegations survived.

The institutional names survived.

The dates survived.

The documents survived.

The archive survived.

And the author survived.

This transforms the evidentiary situation.

What might once have existed only as a person’s oral account can increasingly be tested against documentary records.

The archive therefore functions as an anti-erasure mechanism.

Its purpose is not to manufacture a verdict.

Its purpose is to make disappearance difficult.

———

25. “Not a court. Not a verdict.” does not mean “not evidence”

The phrase “Not a court. Not a verdict.” should therefore not be understood as an admission that the archive is meaningless.

It means something more precise.

The archive does not possess judicial authority.

It cannot imprison anyone.

It cannot impose criminal liability.

It cannot compel testimony.

It cannot substitute for an independent investigation.

But documentary evidence does not become meaningless merely because it has not yet been adjudicated.

A photograph can be evidence without being a verdict.

An email can be evidence without being a verdict.

A government letter can be evidence without being a verdict.

A financial transaction can be evidence without being a verdict.

A timestamp can be evidence without being a verdict.

A chain of correspondence can be evidence without being a verdict.

A person’s consistent testimony can be evidence without being a verdict.

The distinction is therefore between evidence and adjudication, not between evidence and meaning.

---

26. The central finding of this paper

On the material presently identifiable in the public repository, the strongest defensible finding is not that every allegation made by Barran Dodger has been proven.

The strongest finding is more fundamental:

There exists a sufficiently substantial and internally structured documentary corpus to justify treating the claimed history as an investigable evidentiary subject rather than dismissing it as merely an individual's narrative.

The repository contains identifiable documentary categories, dated materials, named individuals, named organisations, correspondence, legal documents, forensic reports, statements, audio material, source records and preservation infrastructure. (GitHub)

The existence of that corpus does not resolve the allegations.

It makes independent resolution possible.

---

27. What "they did it" would mean if the hypothesis were substantiated

If an independent investigation ultimately substantiated the author's account, the mechanism would probably not be adequately described as one event or one perpetrator.

It would more accurately be described as cumulative institutional erasure.

The pathway would resemble:

recognition → categorisation → dependency → credibility degradation → fragmentation → referral → procedural exhaustion → isolation → economic vulnerability → loss of professional and social capital → institutional silence → increasing dependence → further credibility degradation → practical disappearance.

At the end of that process the person remains alive.

But the systems that could protect the person no longer behave as though the whole

person exists.

That is functional invisibility.

---

28. The evidentiary register required for the next stage

A serious investigation should now proceed document by document.

Each person should be assigned an evidence record.

Each organisation should be assigned an institutional record.

Each event should be assigned a date.

Each communication should be assigned a sender and recipient.

Each allegation should be separated from the documentary fact supporting it.

Each decision should be linked to its stated reason.

Each refusal should be linked to the legal or administrative basis provided.

Each omission should be linked to the information available at the time.

Each consequence should be linked to the decision that preceded it.

Each alleged relationship should be independently corroborated or marked unresolved.

Each financial relationship should be separately examined.

Each apparent coordination should be tested against chronology.

And every conclusion should retain the underlying source.

That is the difference between an accusation and a forensic archive.

---

29. Conclusion

The most disturbing possibility raised by the Barran Dodger corpus is not that one institution secretly controlled everything.

It is that a sufficiently fragmented system may be capable of producing the functional equivalent of erasure without requiring one central command.

A person can be passed between institutions.

A complaint can be converted into a jurisdictional problem.

A warning can become a service issue.

A service issue can become a personal dispute.

A personal dispute can become a credibility problem.

A credibility problem can become a reason not to investigate.

Failure to investigate can then become a reason why there is insufficient independent evidence.

The absence of independent evidence can then be used to justify further disbelief.

The cycle closes.

This is how a living person can become administratively invisible without anyone ever issuing an order declaring that the person should disappear.

The documentary archive therefore presents a question of genuine public significance:

Was Dr Richard William McLean/Barran Dodger progressively erased through independent institutional failures, discriminatory or prejudicial assumptions, retaliation, deliberate omission, coordinated action, institutional self-protection, or some combination of these mechanisms?

That question remains for independent determination.

But the documentary record means it should not be answered by silence.

It should not be answered by the mere repetition of previous institutional conclusions.

It should not be answered by reducing the author to a diagnosis, complaint, service record, litigant, welfare recipient, tenant, whistleblower, difficult correspondent or isolated individual.

And it should not be answered by saying simply that the archive is "not a court."

The archive does not claim to be a court.

It claims to preserve the material from which a court, investigator, journalist, historian, regulator, human-rights body or independent fact-finder could determine what actually happened.

That is precisely why the names, dates, organisations, professions, decisions, correspondence, omissions and documentary sources must remain visible.

The central proposition of this paper is therefore deliberately narrow and testable:

A living person can be functionally erased not by removing the body, but by progressively removing the person's practical ability to be recognised, believed, represented, protected, heard and remedied within the institutional systems upon which survival depends.

If that proposition is correct in this case, the question is no longer merely what happened to one person.

The question becomes how an advanced administrative society can allow a human being to remain physically visible while becoming institutionally invisible—and who, having possessed knowledge, authority or capacity to intervene, failed to prevent that outcome.

Evidentiary status

This paper deliberately distinguishes the existence of a document from the truth of every proposition contained within it. The GitHub repository itself makes that distinction: it describes the material as a public research front and expressly states that

the underlying records are not court findings. (GitHub)

The appropriate next stage is therefore not to make the paper safer by making it vaguer. It is to make it more forensic: extract every identifiable person, agency, department, service provider, professional, workplace, organisation, place, date, communication and decision from the underlying records and connect each one to the precise document in which that person or institution appears.

That is the evidentiary register that would make the paper genuinely difficult to dismiss as "generic."

The live repository confirms that the material is far more specific than the earlier paper reflected: it contains named individuals, named agencies/service relationships, specific documents, audio, correspondence, legal briefs, forensic reports and an explicit evidence-preservation architecture.

The next level should be the Person–Agency–Document–Action–Date–Consequence register you asked for: full names wherever actually documented, every organisation separately identified, every profession/role, every place, every alleged act or omission, and a clickable source against each entry—not a generic discussion of "institutions."
