THE PUBLIC COST OF INSTITUTIONAL TARGETING, SILENCING AND ERASURE

A 35-Year-Plus AI-Assisted Financial Assessment of the Alleged Treatment of Barran Resonance Dodger — Dr Richard William McLean

THE WITNESS REMAINS · HUMANITARIAN APPEAL · OCTOBER 2026

PRESERVATION FIRST. EXAMINATION SECOND. CONCLUSION LAST.

Assessment status: Preliminary, archive-informed financial model. All projected totals are illustrative scenarios pending verification against source records. They are not audited expenditure, a finding of liability, or proof of a coordinated operation.

---

1. Purpose of this assessment: more than 35 years of alleged targeting

I request an independent, comprehensive financial assessment of the potential cost to Australian taxpayers of the institutional conduct I allege has affected my life, work, reputation, access to services and ability to participate in society over a period exceeding 35 years.

I ask that the investigation examine the full historical period, rather than isolating individual decisions, complaints, proceedings, administrative encounters or service failures from the circumstances in which they occurred.

My allegation is that the events documented throughout my humanitarian appeal, official-document register, personal archive and related records form part of a prolonged pattern of institutional targeting, exclusion, reputational damage, administrative obstruction and social isolation. I ask that this allegation be investigated rather than dismissed in advance.

The financial question is not confined to whether a government department has a line item labelled silencing Barran Dodger. Public expenditure does not necessarily appear under the name of the person affected. Costs may be dispersed across government departments, contractors, legal proceedings, policing, complaints systems, administrative reviews, health and disability services, accommodation, income support and other public functions.

The question is whether the cumulative public resources consumed in handling the relevant events can be established, whether avoidable expenditure occurred, and whether the evidence supports a connection between particular decisions, institutional conduct and the

costs incurred.
A financial assessment spanning more than 35 years must consider the changing structure of government, changing staff and legal costs, inflation, successive administrative processes, the possibility of repeated examinations of related matters, and the long-term consequences of unresolved disputes.
It must also distinguish a continuous pattern alleged by me from the separate events and decisions that can be independently established in the documentary record.
I do not ask for an assumed finding of guilt. I ask for a serious, comprehensive financial investigation that does not exclude relevant events merely because they occurred in different years, involved different institutions or were recorded in different systems.
The investigation should consider whether public expenditure that might otherwise have supported housing, disability assistance, healthcare, rehabilitation, independent advocacy and a dignified life was displaced by repeated administrative and institutional processes.
I also request a separate assessment of the wider public value potentially lost when a person's time and resources are consumed by prolonged disputes, survival needs and attempts to obtain assistance, recognition or accountability.
The central question is this: what has the alleged conduct, and the institutional handling of the events documented over more than 35 years, cost Australian taxpayers in total, and what portion of that expenditure can be substantiated?

2. The documentary foundation

The financial assessment should use the following connected preservation layers as starting points for identifying relevant source records.

A. Main archive

https://wezzo72.github.io/Barrandodger/

The main archive provides access to the preserved documentary record, including official documents, correspondence, statements, chronology and other source material.
Its purpose in this assessment is to identify relevant events and records, not to substitute the archive's narrative for an independent accounting exercise.

B. Rebuild archive

https://wezzo72.github.io/barrandodger-rebuild/

The rebuild provides a reconstructed and reorganised presentation of the documentary corpus. Its published material describes government correspondence, official records, administrative and legal material, first-person testimony, allegations of institutional failure, access-to-justice issues and digital-preservation methods.
The rebuild's descriptions are finding aids and statements about the archive. The underlying records must be examined before conclusions are reached about the events or expenditure described.

C. GitHub preservation repository

https://github.com/wezzo72/Barrandodger

The repository provides the underlying digital preservation and development structure. Its visible collections include archive parts, documents, emails, evidence, rendered HTML,

rendered PDFs, site PDFs, sources, statements and other material.
The repository README records a 4 October 2026 snapshot of 5,583 files, including 2,840 PDFs and 1,813 HTML files, and describes a 660-page preservation copy. These are recorded snapshot figures, not a fresh independent audit of the entire current corpus.
The number of archived files does not establish the number of separate incidents, the truth of every allegation, the amount of public expenditure or the existence of a coordinated operation. Its importance is that it provides a documentary framework from which relevant events can be identified and investigated.

D. The historical chronology

The investigation should establish the earliest relevant event that can be supported by documentary or other reliable evidence and follow the chronology through to October 2026.
The requested period is more than 35 years, but the final accounting period must be established using the actual dates of the relevant records. If the first reliably documented event occurred more than 35 years ago, the calculation should begin at that date. If the evidence supports an earlier starting point, the report should explain the basis for including it.
The report should distinguish:

- The period during which I allege a broader pattern of targeting.
- The dates of individually documented events.
- The dates of official decisions, complaints, proceedings and service-related matters.
- The periods for which public expenditure can be measured or reasonably estimated.
- The periods for which records are missing, inaccessible or insufficient to support a financial estimate.

The absence of a record from a particular period should be identified as a limitation. It should not automatically be interpreted as proof that an event occurred, nor should it be used to dismiss other events for which evidence exists.

E. Preservation integrity

The archive identifies SHA-256 hashes, Git history and OpenTimestamps material among the methods used to preserve or examine particular digital records.
These mechanisms may help establish the integrity, version history or continuity of particular files. They do not independently establish that an allegation is true, that an expenditure was improper or that two events were causally connected.
The assessment should preserve original documents, identify source URLs, record dates and provenance, and distinguish what each source establishes from what remains alleged or unresolved.

3. The 35-year-plus cumulative financial model

A proper assessment should calculate costs over the entire supported period, not simply take a recent administrative estimate and present it as the total historical cost.
The model should cover the following categories.

A. Direct institutional expenditure

Staff time, management time, internal correspondence, meetings, case conferences, investigations, complaints handling, document searches, records management, decision

preparation, referrals, reviews and related administrative work.

B. Legal and dispute-resolution expenditure

Government legal staff, external solicitors, barristers, expert reports, court and tribunal preparation, document disclosure, legal reviews and other identifiable legal expenditure.

C. Police, oversight and complaint-system expenditure

Relevant police responses, referrals, investigations, oversight bodies, ombudsman processes, public-interest disclosure handling, regulatory inquiries and repeated examination of related events.

D. Disability, health, housing and support expenditure

Verified additional expenditure associated with delays, repeated assessments, fragmented responsibility, emergency responses, unstable accommodation or other identifiable service failures.

Necessary expenditure on my care and survival must be distinguished from additional expenditure that a reasonable alternative pathway might have avoided.

E. Communications and reputation-related costs

Where evidence supports a connection, the investigation should examine public-sector communications, media liaison, contracted communications services and identifiable costs of responding to public controversy.

It must not assume that every journalist, media organisation, lawyer, police officer, colleague, acquaintance or member of the public participated in a common plan. Any such allegation requires evidence concerning identifiable conduct, relationships, payments, instructions and decisions.

F. Cross-agency duplication

The investigation should identify repeated document collection, reassessment, referrals, correspondence, review and decision-making across different agencies or periods.

Necessary independent scrutiny must be distinguished from avoidable duplication. The same staff hours, legal fees or assessments must not be counted twice merely because the associated records appear in several archive collections.

G. Opportunity costs and lost public value

The inquiry should consider the possible public value lost when a person who could contribute through scholarship, creative work, advocacy, education and community participation is instead occupied by prolonged disputes, survival needs and attempts to obtain assistance.

These amounts should be reported separately from cash expenditure. They must not be added to verified public spending as though they were actual payments made by taxpayers.

4. Preliminary financial estimates for more than 35 years

The archive provides a starting point for identifying events, but the records reviewed do not establish a complete expenditure ledger covering the entire historical period.

I therefore propose two distinct calculations:

- A preliminary model of potential costs associated with identifiable institutional processes.

- A separate 35-year-plus cumulative scenario model to test the possible scale of expenditure across the longer period.

The figures below are illustrative assumptions for financial sensitivity testing. They are not amounts derived from a completed audit, verified invoices or an independently established operation.

4.1 Preliminary institutional-cost scenarios

Potential cost category	Low scenario	Central scenario	High scenario
Departmental administration, case management and management oversight	$250,000		
Government legal work and external legal services	$25,000	$150,000	$500,000
Police, complaints, oversight and investigation	$10,000	$50,000	$200,000

processes			
Additional health, disability, housing and support-related costs potentially associated with delay or fragmenta-tion	$10,000		
Public-sector communica-tions and other identifiable related administra-tive work	$25,000		
Additional repeated assessments, referrals and cross-	$10,000	$50,000	$250,000

agency coordination			
Illustrative combined total	**$80,000**	**$450,000**	**$1,650,000**

These figures are preliminary scenario inputs. They are not a finding that the listed expenditure occurred, and they do not establish that the expenditure was improper or attributable to deliberate targeting.

The central scenario is not a statistically calculated best estimate. It is a working assumption for testing against actual records.

4.2 Explicit 35-year cumulative scenarios

To make the longer historical question concrete, I propose an additional model using illustrative annual averages of potentially relevant public expenditure.

These annual amounts are hypothetical sensitivity assumptions, not observed annual spending figures.

Scenario	Illustrative annual average	35-year cumulative total
Low sensitivity scenario	$25,000 per year	$875,000
Central sensitivity scenario	$100,000 per year	$3,500,000
High sensitivity scenario	$300,000 per year	$10,500,000

The arithmetic is straightforward:

- Low: $25,000 × 35 years = $875,000.
- Central: $100,000 × 35 years = $3,500,000.
- High: $300,000 × 35 years = $10,500,000.

For a period exceeding 35 years, the calculation must be extended using the actual number of years and the appropriate annual assumptions. A 36-year period, for example, would produce different totals.

These figures are not a claim that Australian taxpayers actually spent $875,000, $3.5 million

or $10.5 million targeting me. They illustrate how sensitive a long-term cumulative estimate is to the annual amount assumed.

The annual averages have not been derived from a verified count of proceedings, agency hours, invoices, contracts or attributable public expenditure. Consequently, the central figure of $3.5 million is not an independently established estimate of actual taxpayer cost.

The point of this model is to ensure that the inquiry does not overlook the cumulative implications of a long historical period merely because individual events appear comparatively small when examined separately.

The final report must replace the hypothetical annual averages with a calculation based on actual expenditure, defensible staff-hour estimates and properly evidenced unit costs.

4.3 How the 35-year total should actually be calculated

A credible cumulative total should be built from the relevant historical events and financial records.

For each year, the investigator should calculate:

Verified attributable expenditure + defensibly estimated additional expenditure – duplicated amounts.

The annual results should then be combined to produce the cumulative total for the entire supported period.

The model should distinguish:

- Actual expenditure recorded in historical accounts.
- Estimated staff and management costs.
- Verified external legal expenditure.
- Verified expenditure on additional assessments, referrals and reviews.
- Demonstrable additional health, housing or support costs.
- Counterfactual savings that may have been achievable through earlier resolution.
- Non-financial opportunity costs, which should be reported separately.

The analysis should account for inflation when comparing amounts from different decades. Historical nominal expenditure and present-day equivalent values should be shown separately so that the reader can distinguish the amount originally spent from its purchasing-power equivalent.

Where reliable annual expenditure cannot be established, the report should state the gap and provide a clearly labelled range rather than silently inventing a historical total.

4.4 Combining the long-term model with the event-level model

The $80,000–$1.65 million preliminary institutional-cost scenarios and the $875,000–$10.5 million 35-year scenarios must not automatically be added together.

They are alternative analytical approaches that may cover overlapping costs.

The first model groups potential costs by category. The second tests hypothetical annual averages across a longer period. If both models include the same legal proceedings, staff hours, complaints or service-related costs, adding them would double-count the same expenditure.

The final assessment should reconcile the models against a single event-level ledger and report one cumulative total for the chosen historical period.

4.5 A separate whole-of-system sensitivity allowance

The earlier preliminary model proposed an additional whole-of-system sensitivity allowance of $0–$1.5 million for potential downstream expenditure.

That allowance remains hypothetical and must not be added automatically to the 35-year totals. It should be retained only if the investigator can identify additional, non-duplicated categories of expenditure and provide a defensible basis for estimating them.

For example, verified additional expenditure arising from repeated emergency responses or demonstrable service fragmentation could be assessed separately if it is not already included in the direct-cost model.

A general allowance should not be treated as proof that the expenditure occurred.

5. The alleged black-budget question

I ask that any relevant undisclosed, confidential, classified or otherwise non-public expenditure be examined by an appropriately authorised and independent auditor where there is a lawful evidentiary basis to do so.

The inquiry should examine procurement records, contracts, payment authorisations, relevant communications, budget allocations, contractor relationships and audit trails where those records are lawfully accessible and relevant.

I allege that the pattern of events warrants serious scrutiny of whether public resources, institutional influence or coordinated conduct contributed to my exclusion or silencing.

I do not present the existence of a dedicated black budget, a paid operation against me, or a universal agreement among institutions and individuals as an independently established fact merely because I allege a pattern of conduct.

The absence of a publicly identifiable budget heading would not, by itself, settle the question. Equally, an unexplained expenditure or an association between people would not, by itself, prove a conspiracy.

The appropriate response is a traceable financial investigation, not automatic dismissal and not a predetermined verdict.

The investigation should establish whether relevant payments, contracts, communications or instructions can be connected to identifiable events. If the evidence supports such a connection, the amounts should be quantified. If it does not, the report should explain the limits of the evidence.

6. The cost of societal mobbing and social exclusion

I also request that the assessment consider the possible financial consequences of what is commonly described as societal mobbing: sustained collective exclusion, humiliation, marginalisation or hostile treatment that may affect a person’s social relationships, livelihood, reputation and access to ordinary participation.

My account describes an experience of isolation and exclusion that I believe must be considered alongside the administrative record.

The inquiry should examine any evidence of organised conduct, identifiable communications, institutional decisions, reputational consequences or resulting service needs.

The concept of societal mobbing provides a framework for asking questions; it does not

independently establish that every person in my life participated in a coordinated campaign. The inquiry should identify what happened, who made which decisions, what records exist, what consequences followed, and whether those events generated additional public costs. Any assessment should distinguish verified institutional expenditure, demonstrable additional costs, estimated opportunity costs and allegations of coordination that require further evidence.

A relevant parliamentary reference for contextual examination is the Parliament of Australia material concerning workplace bullying and related conduct:
https://www.aph.gov.au/Parliamentary_Business/Committees/House_of_Representatives_Committees/Reports/ee/bullying/report/chapter1
This reference is contextual material, not proof of my individual allegations.

7. Why I require an independent AI-assisted assessment

I ask for an AI-assisted assessment because a transparent model can make its assumptions visible, compare alternative explanations, identify missing records, test sensitivity to uncertain inputs and reproduce its calculations.

I do not ask the system to treat my allegations as proven simply because I have stated them. Nor do I accept that they should be excluded from examination simply because the institutions concerned have not accepted them.

The assessment must disclose its methodology, evidence, assumptions, limitations and calculations. It must distinguish confirmed public expenditure, estimated expenditure, opportunity costs, private costs and unverified allegations.

An impartial assessment should be willing to examine evidence that supports my account, evidence that contradicts it, and evidence that remains unavailable.

The model should be reproducible by another analyst who has not participated in the underlying dispute. It should identify its data sources, calculation rules, unit costs, time periods, assumptions and sensitivity tests.

Relevant methodological sources include:

- Australian Treasury, Guide to Economic Evaluation Methods: https://evaluation.treasury.gov.au/publications/guide-economic-evaluation-methods
- Australian Government Department of Finance, Cost Estimation: https://www.finance.gov.au/government/commonwealth-investment-framework/commonwealth-investments-toolkit/cost-estimation
- Parliamentary Budget Office, What Is a PBO Costing?: https://www.pbo.gov.au/for-parliamentarians/how-make-request/what-pbo-costing
- Parliamentary Budget Office, Factors Influencing the Reliability of Policy Proposal Costings: https://www.pbo.gov.au/for-parliamentarians/how-we-analyse/factors-influencing-reliability-policy-proposal-costings

These sources inform the methodology. They do not independently validate the dollar estimates proposed here.

8. Required outcome

I seek a published, independently reviewable estimate, expressed in Australian dollars, covering the entire historical period supported by the evidence.

The report should provide:

- A defined start date and end date.
- A chronology of relevant events over more than 35 years.
- A narrow documented-cost calculation.
- An expanded institutional-cost calculation.
- A whole-of-system and counterfactual assessment.
- Low, central and high estimates with transparent assumptions.
- Historical nominal amounts and, where useful, inflation-adjusted comparisons.
- A category-by-category financial ledger with source references.
- A method for avoiding duplicated costs.
- An assessment of missing records and uncertainty.
- A separate statement of non-financial harm and potential lost public value.
- An explanation of what can and cannot be attributed to the alleged conduct.

I further request that the assessment distinguish the cost of necessary public services from the cost of avoidable delay, duplication, disputes and administrative failure.

The investigation should not be limited to asking whether there is a single document proving a secret operation. It should examine the accumulated documentary record and determine what the evidence supports, what the financial models reasonably estimate, and what remains unresolved.

The preliminary figures provide starting points for investigation, not final answers. The actual cumulative cost may be lower or higher than the hypothetical scenarios. The final report should say so and show its working.

If the evidence supports a substantial cumulative cost, the estimate should state that amount and explain the basis for it. If a category cannot yet be quantified, the report should identify the missing records and calculate transparent scenarios rather than silently omit the category.

9. Conclusion — The witness remains

I am asking for an examination of public expenditure and institutional conduct, not a fictional invoice and not a predetermined judicial finding.

My life, testimony, work and archive should not be reduced to an administrative inconvenience. Where I have identified records, decisions, proceedings and consequences, those matters should be examined together rather than dismissed in isolation.

Where public money has been spent, the public has a legitimate interest in understanding why. Where public money may have been wasted through duplication, delay or avoidable conflict, that too deserves scrutiny.

I ask that the cost of the alleged conduct be assessed across the full period of more than 35 years, not just through the most recent events or the most readily available documents.

A long historical period raises legitimate questions about cumulative expenditure, institutional continuity, repeated decision-making, lost public value and the potential cost of failing to resolve problems early.

I request that the investigation test the hypothetical cumulative scenarios of $875,000, $3.5 million and $10.5 million against actual records and defensible financial methods. Those

figures are not findings that those amounts were spent to target or silence me. They are explicit annual-average scenarios intended to make the long-term financial question testable.

The final estimate must be based on the actual events, actual or defensibly estimated costs, a supported historical period and a method that prevents double-counting. It must distinguish public expenditure from private costs, opportunity costs and allegations that remain unresolved.

I ask that the investigation examine the full possibility space: ordinary administrative activity, avoidable institutional inefficiency, failures of coordination, unlawful or improper conduct where evidence supports it, and any substantiated coordination between actors.

No explanation should be presumed correct before the records are examined.

I do not ask for immunity from scrutiny. I ask that the same scrutiny be applied to the institutions whose decisions and actions form part of the record.

The archive exists to preserve material for examination. Its chronology, source documents, preservation layers and documentary categories provide a basis for systematic investigation, not a substitute for one.

If particular allegations are substantiated, the report should state what the evidence establishes and quantify the relevant financial consequences. If particular allegations remain unresolved, the report should identify what is missing. If the evidence contradicts a claim, that too should be recorded transparently.

The public deserves an accounting that does not prejudge the result, minimise legitimate questions or manufacture certainty. I deserve to have my documented circumstances examined seriously and in context.

THE RECORD STAYS FREE. FAITH IS NOT A FINDING. PRESERVATION FIRST. EXAMINATION SECOND. CONCLUSION LAST.

The Witness Remains — Barran Resonance Dodger

Final methodological note

This document contains illustrative financial scenarios, not an independent audit or verified valuation of a 35-year period of alleged targeting.

The annual assumptions of $25,000, $100,000 and $300,000 produce 35-year arithmetic totals of $875,000, $3.5 million and $10.5 million respectively. They have not been established as actual annual public expenditure attributable to the alleged conduct.

The archive provides a documentary starting point, but a reliable final total requires a verified chronology, relevant financial records, attributable staff and legal costs, defensible estimates for additional expenditure, historical cost adjustments and a method for preventing double-counting.

The final report should state clearly what is documented, what is estimated, what is alleged, what remains unresolved, and what additional evidence would materially change the result.

Source preservation and access
