DOCUMENT CONTROL

Title: Forensic AI Digital Archive Value Assessment

Record: The Witness Remains · Barran Dodger Rebuild Archive · Church of Barran Dodger

Assessment date: 8 October 2026

Recorded: Thursday 8 October 2026, 20:38:40 Australian Eastern Daylight Time (AEDT, UTC+11)

UTC: 2026-10-08T09:38:40Z

ISO-8601: 2026-10-08T20:38:40+11:00

Prepared by: AI analytical assessment

Currency: Australian dollars

Central indicative figure: A\$350,000

Low: A\$175,000

High: A\$500,000–A\$650,000+

Historical / cultural value: not responsibly monetisable

Status: Indicative forensic-style replacement/creation-value assessment.

Not a certified professional valuation.

Not a prediction of a sale price.

Not a court. Not a verdict.

Appearance is not a finding.

A figure in this assessment is not a finding that a contested proposition is true.

The SHA-256 digest of the finished PDF is not printed inside the PDF.

It is recorded in the companion stamp, so the digest remains the digest of these bytes.

OpenTimestamps

Stamp record: stamps/FORENSIC-AI-DIGITAL-ARCHIVE-VALUE-ASSESSMENT-8-OCTOBER-2026.stamp.txt

FORENSIC AI DIGITAL ARCHIVE VALUE ASSESSMENT

THE WITNESS REMAINS · BARRAN DODGER REBUILD ARCHIVE · CHURCH OF BARRAN DODGER

Assessment date: 8 October 2026

Assessment type: Indicative forensic-style digital asset, documentary corpus and replacement/creation-value assessment

Prepared by: AI analytical assessment

Currency: Australian dollars

1. EXECUTIVE FINDING

Following examination of the publicly accessible Barran Dodger GitHub repository and its documented archive structure, the earlier A\$300,000 central assessment should be revised upward.

The repository evidence demonstrates that the project is not simply a website containing a collection of documents.

It is a multi-layer digital documentary preservation system incorporating source material, evidence collections, website backups, rendered PDFs and HTML, preservation files, hashes, timestamps, source texts, statements, emails, imports, data files, scripts, archive indexes and historical reconstruction material.

The principal GitHub repository currently reports 937 commits and contains dedicated directories including archive-parts, barrandodger.com website backup, data, docs, emails, evidence, rendered-html, rendered-pdfs, site-mirror, site-pdfs, sources, stamps, statements and tabs. (GitHub)

The repository's own 4 October 2026 dataset inventory provides considerably stronger quantitative evidence than the earlier website-only assessment:

- 3,215 unique complete PDFs;
- 3,667 unique PDF blobs including stubs;
- 452 stub PDFs;
- 10,001 PDF instances including mirrors;
- 21,197 archive-path file instances, excluding node_modules;
- 8,819 unique archive-path blobs;
- material distributed across 8 repositories;
- 3 additional empty repositories examined;
- 2,655 SHA256SUMS lines containing 2,569 distinct SHA-256 values;
- 3 OpenTimestamps files identified in the current inventory;
- 95 official-drive PDFs in the relevant folder;
- and a preserved 660-page crawl of the former barrandodger.com website. (GitHub)

The repository also preserves a documented historical chain of restoration anchors, including specific Git commit SHAs, source-text files, historical HTML and CDN copies. (GitHub)

REVISED CENTRAL INDICATIVE VALUE:

A\$350,000

with the following scenario range:

LOW: A\$175,000

CENTRAL: A\$350,000

HIGH: A\$500,000–A\$650,000+

HISTORICAL / CULTURAL VALUE: NOT RESPONSIBLY MONETISABLE

This remains a replacement/creation-value assessment, not a certified professional valuation or prediction of a sale price.

2. WHAT THE REPOSITORY EVIDENCE CHANGES

The earlier valuation was necessarily weighted toward the surviving websites and the reported statistics displayed upon them.

The GitHub evidence materially changes the evidentiary foundation because it provides an independently observable technical record of the underlying archive.

The repository is publicly accessible and currently records 937 commits. It is not merely a static website repository: it contains numerous separate documentary, preservation, data, source, evidence and reconstruction areas. (GitHub)

Most importantly, the repository's own dataset changelog distinguishes between:

individual files, unique documents, duplicate instances, mirrors, historical website crawls and repository-path objects.

That distinction is exactly what a defensible valuation methodology requires.

The inventory states that its counts were taken from the Git trees of both GitHub accounts and records 3,215 unique complete PDFs, 10,001 PDF instances, 21,197 archive-path file instances, and 8,819 unique archive-path blobs. (GitHub)

This substantially strengthens the conclusion that the archive represents a large documentary corpus requiring substantial replacement labour.

3. DOCUMENTARY CORPUS — QUANTITATIVE FINDING

The most important repository-based finding is:

3,215 UNIQUE COMPLETE PDFs

This is materially different from simply saying that the archive contains thousands of files.

The same inventory separately identifies:

- 3,215 unique complete PDFs;
- 452 stub PDFs;
- 3,667 unique PDF blobs including stubs;
- 10,001 PDF instances including mirrors;
- 21,197 archive-path file instances;
- 8,819 unique archive-path blobs. (GitHub)

This allows the valuation to avoid the serious error of multiplying the value of every mirrored copy as though it were a separate substantive document.

Instead, the unique corpus receives the principal documentary value, while the instances and mirrors receive technical and preservation value.

That is a materially stronger valuation method.

4. PRESERVATION AND PROVENANCE INFRASTRUCTURE

The repository contains evidence of an intentional preservation architecture.

The repository documentation expressly states:

> ORIGINAL EVIDENCE MUST REMAIN PRESERVED. Website presentation may change. Underlying records must not be altered. (GitHub: <https://github.com/wezzo72/Barrandodger>)

The repository further documents official-drive source material, catalogues and historical preservation copies.

As of the 4 October 2026 inventory, the docs/official-drive/ collection contained 95 PDFs, with the repository expressly distinguishing those documents as the party's copies rather than court findings. (GitHub)

This distinction is important.

The valuation does not convert the existence of a PDF into proof of the proposition contained within it.

Instead, the valuation recognises the cost of preserving, cataloguing, indexing and making the documentary object available for examination.

5. CRYPTOGRAPHIC PRESERVATION EVIDENCE

The repository's dataset changelog identifies:

- SHA256SUMS.txt containing 2,655 lines;
- 2,569 distinct SHA-256 values;
- 68 SHA-256 values in a Gmail/Drive sweep list;
- and 3 OpenTimestamps files. (GitHub)

The changelog also makes an important qualification:

> A recorded hash was not checked again against the file bytes in that inventory pass.

Accordingly, the existence of recorded hashes is treated as evidence of a preservation methodology and integrity-record infrastructure, not as proof that every underlying proposition is true or that every hash has been

independently recomputed.

This is precisely the type of distinction required in a forensic-style valuation.

6. VERSION HISTORY AS AN ASSET

The repository contains 937 Git commits. (GitHub)

The command and edit log additionally identifies specific historical commit anchors, including:

- a 45KB original Home document;
- historical tab structures;
- forensic report source files;
- source-text folders;
- historical landing-page versions;
- and specific commit SHAs capable of reconstructing earlier states. (GitHub)

This has replacement value.

A conventional website backup preserves files.

A version-controlled archive can preserve:

what existed → when it existed → what changed → which version contained it → how it can be restored.

That historical reconstruction capability is materially more expensive to recreate than simply copying a current website.

7. HISTORICAL WEBSITE PRESERVATION

The repository records that the former barrandodger.com preservation copy contains:

660 indexed pages

The dataset changelog specifically identifies the 660-page figure as a preservation crawl of the public site, while correctly warning that it is not the total dataset. (GitHub)

That distinction strengthens rather than weakens the valuation.

The 660 pages should be valued as a historical website reconstruction asset, while the thousands of documentary objects should be valued separately.

8. MULTI-REPOSITORY REDUNDANCY

The current inventory reports files across:

8 repositories

This is important because redundancy has both a cost and a preservation benefit.

The project documentation identifies a primary archive, reconstruction repository and mirror environments, including the Wezzo mirror and the separate historical archive repository. (GitHub)

Redundancy should not be valued by simply multiplying the documentary corpus.

Instead, it contributes value through:

- resilience;
- disaster recovery;
- provenance comparison;
- version comparison;
- availability after domain loss;
- independent access paths;
- and reduced dependence upon one hosting provider.

9. REPOSITORY STRUCTURE

The current repository includes dedicated areas for:

- evidence;
- sources;
- statements;
- emails;
- archive parts;
- rendered HTML;
- rendered PDFs;
- site PDFs;
- site mirrors;
- stamps;
- data;
- scripts;
- imports;
- Dropbox imports;
- Gmail/Drive sweeps;
- and website backup material. (GitHub)

This is evidence of a documentary information architecture, rather than merely a personal webpage.

The replacement cost therefore includes information architecture and archival engineering, not just web design.

10. HISTORICAL DOWNLOAD EVIDENCE

The historical landing-page material reports:

1,308,148 document downloads

That figure remains potentially important evidence of historical utilisation.

However:

downloads $\neq$ unique people

and

server requests $\neq$ document downloads.

The valuation therefore treats the download figure as a utilisation indicator, rather than assigning an arbitrary dollar amount to every download.

If the original Replit analytics database/export can be produced, the confidence assigned to the utilisation component should increase.

11. VALUE COMPONENTS — REVISED

The repository evidence supports the following replacement-cost components.

A. Documentary corpus

3,215 unique complete PDFs plus associated documentary material.

Indicative value: A\$50,000–A\$100,000

B. Document processing and preservation

OCR, conversion, metadata, classification, naming, storage, duplication analysis and preservation.

Indicative value: A\$30,000–A\$65,000

C. Indexing and information architecture

Finding aids, archive indexes, chronology, categories, navigation, documentary relationships and source classification.

Indicative value: A\$25,000–A\$55,000

D. Research and editorial labour

Research, writing, synthesis, cross-referencing, legal/academic framing and documentary descriptions.

Indicative value: A\$40,000–A\$90,000

E. Cryptographic and preservation infrastructure

SHA-256 inventories, OpenTimestamps, repository history, mirrors, preservation copies and integrity infrastructure.

Indicative value: A\$20,000–A\$45,000

F. Historical website reconstruction

660-page preservation crawl, historical website architecture, HTML, links, navigation and reconstruction.

Indicative value: A\$25,000–A\$50,000

G. Technical repository engineering

937-commit version history, scripts, build infrastructure, rendered material, site mirrors and archive tooling.

Indicative value: A\$25,000–A\$60,000

H. Demonstrated historical utilisation

Reported 1.3-million-plus download history and historical international distribution.

Indicative contribution: A\$25,000–A\$75,000

These components are not simply added at their maximum values, because some labour overlaps and some technical infrastructure supports the same documentary objects.

12. TRANSPARENT VALUATION FORMULA

The valuation uses:

> Replacement/Creation Value = Documentary Corpus + Processing + Research + Indexing + Preservation + Technical Infrastructure + Historical Reconstruction + Demonstrated Utilisation – Duplication Adjustment – Uncertainty Adjustment

The model deliberately avoids:

> Downloads × arbitrary dollar value = asset value

because that would not constitute a defensible valuation methodology.

The central question is instead:

> What would another organisation reasonably have to spend to recreate a substantially equivalent documentary, technical, preservation and publication system from scratch?

13. DOCUMENT-LEVEL REPLACEMENT MODEL

Indicative replacement labour is modelled according to document complexity.

Document category	Replacement labour
Simple digital document	0.05–0.15 hours

Standard PDF	0.15–0.40 hours
Scanned/OCR document	0.30–1.00 hours
Complex evidentiary document	1.00–3.00+ hours

For 3,215 unique complete PDFs, even conservative processing assumptions produce a substantial labour requirement.

The calculation also recognises that the archive contains 10,001 PDF instances, meaning the preservation problem includes duplicates, mirrors and multiple archive paths that require identification and management even though they should not be treated as 10,001 independent substantive documents. (GitHub)

14. PROFESSIONAL LABOUR MODEL

Research, editorial, archival and technical work is modelled using conservative professional replacement rates.

Indicative research/editorial rate:

A\$60–A\$120 per hour

Technical development and specialist archival work may reasonably command higher rates depending upon complexity.

The valuation therefore represents the cost of recreating the work, not an assertion that the creator historically paid these rates or received them as remuneration.

15. DUPLICATION ADJUSTMENT

The repository evidence makes a duplication adjustment essential.

The inventory demonstrates that:

- unique complete PDFs = 3,215;
- PDF instances = 10,001;
- archive-path instances = 21,197;
- unique archive-path blobs = 8,819. (GitHub)

Consequently, a naive file-count valuation would significantly overstate value.

The revised model therefore values:

unique documentary content primarily as documentary assets;

while valuing:

duplicates, mirrors and additional paths primarily as preservation, redundancy, provenance and technical infrastructure.

A provisional 10–25% overlap/duplication adjustment remains appropriate where component estimates overlap.

16. EVIDENCE WEIGHTING

A — Directly observable

Highest valuation weight:

- public repository;
- existing files;
- Git history;
- directory structure;
- documentary objects;
- repository manifests;
- published hashes;

-
- source texts;
 - historical website copies.

B — Internally corroborated

Strong but secondary:

- matching historical copies;
- multiple repository versions;
- preservation mirrors;
- historical commit anchors;
- consistent archive inventories.

C — Project-reported / requiring verification

Moderate weight:

- historical Replit analytics;
- exact 1,308,148 download provenance;
- geographic audience claims;
- unique-person reach;
- some historical archive statistics that the current dataset inventory expressly says it could not reproduce.

D — Substantive allegations

Not used to inflate the monetary valuation.

The valuation does not assume that an allegation is true merely because the archive contains a document asserting it.

17. IMPORTANT REPOSITORY QUALIFICATION

The current dataset changelog is particularly valuable because it corrects and contextualises earlier archive numbers.

It states, for example:

- 660 pages = historical public-site crawl;
- 95 PDFs = current official-drive folder;
- 2,840 PDFs / 5,583 files = earlier count for the wezzo72/Barrandodger repository alone;
- 2,304 = project-reported figure printed on preserved public-site pages;
- 3,643 = project-reported figure printed on preserved public-site pages;
- 749 PDFs = title of a preserved archive index;
- 891 = project-reported blockchain timestamp figure not reproduced by the current inventory;
- 788 = historical/project-reported figure not found as the current document total;
- 4,082 = historical figure not reproduced as the current repository total. (GitHub)

This transparency is itself significant.

It prevents historical numbers from being silently conflated with the current unique-document inventory.

18. REVISED VALUE SCENARIOS

LOW — A\$175,000

Assumptions:

- substantial uncertainty regarding historical analytics;
- limited commercial transferability;
- significant overlap;
- conservative labour assumptions;
- no premium for historical significance;
- no assumption that contested claims are true.

LOW INDICATIVE REPLACEMENT VALUE: A\$175,000

19. CENTRAL — A\$350,000

The central scenario now reflects the actual repository evidence.

It assumes:

- approximately 3,215 unique complete PDFs;
- thousands of additional digital objects;
- 937 Git commits;
- multiple repositories;
- 660-page historical website preservation;
- substantial source/evidence/indexing architecture;
- cryptographic preservation infrastructure;
- extensive research/editorial work;
- reconstruction of the former publication environment;
- and historically demonstrated public distribution.

CENTRAL INDICATIVE REPLACEMENT / CREATION VALUE:

A\$350,000

This is the revised figure I consider most defensible on the currently observable evidence.

20. HIGH — A\$500,000–A\$650,000+

The upper scenario becomes defensible if further evidence establishes:

- complete Replit analytics;
- underlying database exports;
- reproducible download records;
- substantial unique-user activity;
- complete repository histories;
- verified provenance for the documentary corpus;
- detailed labour records;
- external institutional/media/research utilisation;
- complete preservation of historical website versions;
- and independent validation of the archival inventory.

Under those conditions:

A\$500,000–A\$650,000+

could represent a reasonable replacement/creation-cost scenario.

Again, this is not a prediction that a buyer would pay that amount.

21. HISTORICAL VALUE

The historical category should remain separate.

HISTORICAL / CULTURAL / PUBLIC-INTEREST VALUE

NOT MONETARILY DETERMINABLE

The archive potentially has a form of value that cannot responsibly be captured by replacement cost.

If it is subsequently used by:

- journalists;
- historians;
- researchers;

-
- lawyers;
 - universities;
 - courts;
 - commissions;
 - public inquiries;
 - archives;
 - libraries;
 - human-rights organisations;
 - or government investigators,

its historical significance may become materially greater than its present replacement cost.

That future significance cannot honestly be assigned a dollar value today.

22. VALUE MATRIX

Category	Revised assessment
---	---:
Conservative low replacement value	A\$175,000
Central replacement/creation value	A\$350,000
High replacement/creation value	A\$500,000–A\$650,000+
Conventional current resale value	Indeterminate; potentially substantially lower
Historical/public-interest value	Not responsibly monetisable

23. FORENSIC VALUE FINDING

The repository evidence establishes that the project should not be characterised merely as a website.

It is better described as:

> A multi-repository documentary preservation and publication system containing thousands of documentary objects, historical website material, version-controlled source history, cryptographic integrity records, mirrors, indexes, evidence collections and reconstructed publication infrastructure.

The GitHub record is particularly significant because the repository itself preserves the evolution of the archive.

The current public repository is therefore simultaneously:

an archive,

a source repository,

a preservation system,

a historical version record,

a website reconstruction,

a finding aid,

and a public dissemination mechanism.

That combination substantially increases the replacement cost.

24. WHAT THE VALUATION DOES NOT SAY

This report does not establish:

- that any alleged crime occurred;
- that any government agency acted unlawfully;
- that any person committed misconduct;
- that any medical allegation is correct;

- that any legal conclusion is binding;
- that every document is authentic merely because it is archived;
- that every recorded hash has been independently recomputed;
- or that 1,308,148 downloads represent 1,308,148 people.

It values the documentary and technical asset itself.

25. CONFIDENCE ASSESSMENT

Component	Confidence
Existence of substantial documentary corpus	High
Current repository structure	High
Git/version history	High
Historical website preservation	High
Cryptographic preservation records	Moderate–High
Unique PDF inventory	High as reported by current repository methodology
Historical download count	Moderate pending raw analytics
Unique human audience	Low–Moderate
Historical significance	Indeterminate
Overall replacement-value assessment	Moderate–High

The strongest unresolved quantitative issue is no longer whether a substantial archive exists.

The repository provides strong observable evidence that it does.

The principal unresolved issue is the independent verification and reconstruction of historical utilisation data, particularly the Replit analytics.

26. FINAL AI ASSESSMENT

After incorporating the current public repository evidence, the valuation should be revised as follows:

- > The integrated Barran Dodger archival project has an indicative documentary replacement/creation value of approximately A\$350,000, with a conservative scenario of approximately A\$175,000 and a high scenario of approximately A\$500,000–A\$650,000 or more if historical analytics, provenance, complete corpus inventories, public reach and external utilisation are independently verified.
- > The repository evidence materially strengthens the assessment because the project now has publicly observable evidence of 3,215 unique complete PDFs, 10,001 PDF instances, 21,197 archive-path file instances, 8,819 unique archive-path blobs, material across eight repositories, 937 Git commits, 2,569 distinct SHA-256 values, 95 official-drive PDFs and a 660-page historical website preservation crawl. (GitHub: https://github.com/wezzo72/Barrandodger/blob/main/DATASET_CHANGELOG.md)
- > The archive’s value is therefore principally a replacement/creation value arising from the enormous amount of documentary, archival, research, technical, indexing, preservation and reconstruction work required to reproduce it.
- > The reported 1,308,148 historical downloads remain potentially significant evidence of public utilisation, but they should be treated as download events rather than unique individuals until the underlying analytics are independently examined.
- > The archive’s ultimate historical, cultural and public-interest significance remains incapable of responsible monetary quantification.

OVERALL AI CLASSIFICATION

LOW — A\$175,000

CENTRAL — A\$350,000

HIGH — A\$500,000–A\$650,000+

HISTORIC — NOT MONETARILY DETERMINABLE

FINAL FORENSIC CHARACTERISATION

The evidence now supports treating the Barran Dodger project as a substantial digital documentary archive and preservation system rather than merely a personal website.

The A\$350,000 central figure is therefore the revised provisional assessment of the cost to recreate a substantially equivalent documentary, technical, archival and publication asset, not a claim that the asset could presently be sold for A\$350,000.

Source: wezzo72/Barrandodger, FORENSIC-AI-DIGITAL-ARCHIVE-VALUE-ASSESSMENT-8-OCTOBER-2026.txt, commit ecd9cf.
This reading copy is not the stamped PDF.

Forensic Archive Value Assessment

Replacement and creation cost, reconciled across four approaches. 8 October 2026.

Status. This is an indicative forensic-style replacement assessment of a public digital archive. It is not a certified valuation, not a sale price, not a debt, and not a finding that any contested allegation is true. A figure is a cost scenario. Appearance is not a finding.

Source record. The earlier assessment of 20:38 AEDT, file FORENSIC-AI-DIGITAL-ARCHIVE-VALUE-ASSESSMENT-8-OCTOBER-2026.txt at commit ecdf9cf, is the base text. This restatement adds the repository-tree index taken later the same evening and reconciles the two counts. The GitHub PDF preview of the base file does not render. The text and this reading copy do.

1. Result

The additional file index does not support adding the component maxima together, and it does not support treating the upper figure as a price. It does support holding the central figure and stating the upper figure as a conditional replacement scenario.

Scenario	Figure	What it is
Low	A\$175,000	Conservative labour, overlap removed, no premium for contested claims.
Central	A\$350,000	Most defensible replacement cost on the observable record.
High	A\$500,000–A\$650,000+	Conditional. Requires analytics, labour records, and independent inventory checks not in this pass.
Historical value	Not monetisable	Public-interest use is not converted into a price.

The high figure is unchanged in amount and tighter in condition. It is the cost of recreating the system if further records are produced. It is not a prediction that a buyer would pay it.

2. What was counted

The evening index read the recursive Git trees of wezzo72/Barrandodger at ecdf9cf, wezzo72/Backup at e0df487, wezzo72/pdf-archive at 4d4e25e, and drbarrandodger/barran-dodger-archive at 9d7d4fb, plus a full listing of the church repository. Myaidrive and the rebuild repository were sighted and not extracted, to avoid counting the same Dropbox import twice.

Repository	PDF paths	Unique blobs	Complete, ≥1 KB	PDF bytes
wezzo72/Barrandodger	3,055	2,684	2,989	5,009 MB
wezzo72/Backup	747	726	747	2,590 MB
wezzo72/pdf-archive	281	249	281	462 MB
drbarrandodger/barran-dodger-archive	1,335	513	64	55 MB
wezzo72/-church-of-barran-dodger	6	6	6	5 MB
Combined, this pass	5,424	3,731	3,278 unique complete	6,948 MB unique complete

The 4 October inventory cited 3,215 unique complete PDFs, 10,001 PDF instances including mirrors, 21,197 archive-path instances, and 8,819 unique archive-path blobs. This pass sees 3,278 unique complete PDF blobs in a narrower set of trees. The difference of 63 is a difference of scope and method. It is not treated as 63 new substantive documents, and it is not given a separate premium.

The primary archive contributes 1,335 PDF paths and 64 complete files. The remaining paths are stubs of about 130 bytes. A stub reserves a name. It is not valued as a document. The docs/official-drive folder contributes 95 PDF paths and 95 unique blobs. Those are party copies of correspondence, not court findings.

3. Approaches

Four approaches were applied. Only the cost approaches have an observable base.

Replacement cost. What another organisation would reasonably spend to assemble a substantially equivalent documentary, indexing, preservation, and publication system from scratch. This is the primary approach.

Reproduction cost. What it would cost to copy the present bytes, hashes, and trees. Copying is cheaper than creation. Reproduction cost is a floor, not the value of the editorial and indexing labour already spent.

Market approach. No comparable sale of this corpus was identified. A personal archive of contested allegations has limited transferability. The market approach is recorded as insufficient, not as zero and not as the high figure.

Income approach. No royalty ledger, subscription income, or reproducible download database was in the trees examined. The reported 1,308,148 downloads are a utilisation indicator. Downloads are not unique people, and server requests are not sales. No income multiple is applied.

4. Component build-up

Components are ranges. They overlap. The central figure is not the sum of the highs.

Component	Indicative range	Basis in the record
Unique documentary corpus	A\$50,000–A\$100,000	3,278 unique complete PDF blobs; stubs excluded.
Processing and preservation	A\$30,000–A\$65,000	Naming, conversion, duplicate control, storage.
Indexing and finding aids	A\$25,000–A\$55,000	Changelogs, official-drive register, path indexes.
Research and editorial labour	A\$40,000–A\$90,000	Synthesis across the corpus. Rate model A\$60–A\$120 an hour.
Integrity infrastructure	A\$20,000–A\$45,000	SHA-256 lists, OpenTimestamps, 937 commits. A hash is not a finding.
Website reconstruction	A\$25,000–A\$50,000	660-page preservation crawl, separate from the document total.
Repository engineering	A\$25,000–A\$60,000	Mirrors, render paths, scripts. Not a second copy of the corpus.
Utilisation indicator	A\$25,000–A\$75,000	Reported download history. Unverified analytics lower this toward the floor.

Unadjusted component lows sum to about A\$240,000. Unadjusted highs sum to about A\$540,000. A 10 to 25 per cent overlap adjustment is applied because indexing, engineering, and preservation describe the same objects. After that adjustment the defensible band sits with the low at A\$175,000 and the central at A\$350,000. The unadjusted high does not reach A\$650,000. The upper scenario is therefore not produced by addition. It is produced only if the missing records in section 6 are later produced.

5. Labour model

Processing time is modelled by document class, not by path count. Simple digital documents, 0.05 to 0.15 hours. Standard PDFs, 0.15 to 0.40 hours. Scanned or OCR documents, 0.30 to 1.00 hours. Complex evidentiary documents, 1.00 to 3.00 hours. At the low processing rate, 3,278 complete blobs imply several hundred hours before research and indexing. At the editorial rate of A\$60 to A\$120 an hour, that labour is already inside the component ranges. It is not added again.

The 10,001 PDF instances in the October inventory, and the 5,424 paths in this pass, are a preservation problem. They are identified so they are not valued as separate documents. Duplicates receive redundancy value only: a second storage path, a comparison copy, a recovery copy.

6. Condition on the high figure

A\$500,000 to A\$650,000 and above remains a replacement-cost scenario, not a bid. It becomes arguable only if these records are produced and checked: the Replit analytics export behind the 1,308,148 download figure; a reproducible unique-user count; labour diaries or invoices; an independent recomputation of the hash lists against file bytes; and evidence of external research or institutional use. None of those checks was completed in this pass. The dataset changelog already states that a recorded hash was not rechecked against file bytes in the inventory pass. That limit is kept.

7. What is not valued

Contested allegations are not given a monetary weight. A PDF that asserts a wrong is evidence that the assertion was preserved. It is not evidence that the wrong occurred, and it is not an item of special damage. Stub files are not valued. Mirrored copies are not multiplied. Historical and cultural use is stated and not priced. No compensation entitlement is calculated. No buyer is identified.

8. Accountability line

The assessment can be checked against the public trees, the text file at commit ecdf9cf, the companion stamp, and the path index. The stamp records the original PDF digest as 31eff9199c2cc30d5491a503aadcc66db76f72441e7240bf5a6294679e0fbe76. This reading copy has its own bytes and is not that digest. A later upload of either file should cite the new commit, not this one.

Finding aid. Not a court. Not a verdict. Not a certified valuation. The high figure is a conditional replacement scenario.

Final result

Note on support, and why this record is not an investment offer

The two preceding assessments are kept together. The first is the repository text of 20:38 AEDT. The second is the evening reconciliation against the public trees. The figures are the same. Low A\$175,000. Central A\$350,000. High A\$500,000 to A\$650,000 and above, and only if further records are produced. Historical value is not priced.

A call for investment is not supported by this assessment. The central figure is a replacement cost: what another organisation might spend to recreate the archive. It is not equity value, not a sale price, not official documentation of worth, and not a return. The official-drive files are party copies of correspondence. They establish that letters exist. They do not value the sites.

A preservation contribution is a different thing from an investment. A contributor who is told the archive may be worth hundreds of thousands, and who is invited to invest on that basis, is being shown a cost scenario as if it were an asset price. That presentation would exceed the record. No revenue, royalty ledger, or comparable sale was found. Transfer of a personal archive of contested allegations is limited. No return can be offered, because none has been established.

If support is sought, the accurate statement is this. The archive is a public preservation project. An indicative replacement assessment places the cost of recreating it in a band from A\$175,000 to a conditional A\$650,000. The most defensible figure on the present record is A\$350,000. Support, if given, is support for preservation and access. It is not a share, not a debt, and not a claim on a future payment.

The named record of this result is THE-WITNESS-REMAINS-ARCHIVE-VALUE-FINAL-8-OCTOBER-2026.pdf. The digest of this combined file is printed in the companion stamp, not in these pages, so the digest remains the digest of these bytes.

Finding aid. Not a court. Not a verdict. Not an offer of securities.
